

IN THE CLAIMS

Kindly amend independent claims 1, 17 and 21 as shown in the attached claim listing:

1. (Currently Amended) In a transceiver having a power amplifier and a pair of up-converter mixers, an improved power ramping method comprising:

switching on the power amplifier after an end of a prior packet reception period and prior to a start of a new packet transmission; and

ramping modulation signals supplied to the up-converter mixers upon initiation of a new packet transmission, wherein the modulation signals are in-phase and quadrature-phase signals and wherein the modulation signals are ramped by monotonically scaling a set of digital words representing the in-phase and quadrature-phase signals.

Claims 2-4 (Cancelled).

5. (Original) The method as described in Claim 1 further including the step of delaying initiation of the new packet transmission for a given time following the end of the prior packet reception period.

6. (Original) The method as described in Claim 1 wherein initiation of the new packet transmission begins with a preamble.

7. (Original) The method as described in Claim 1 wherein the ramping step occurs over a given time period.

Claims 8-16 (Cancelled).

17. (Currently Amended) A power ramping method operative in a transmitter having a power amplifier, comprising:

turning off the power amplifier upon initiation of a packet reception;

upon completion of the packet reception and prior to a start of a new packet transmission, turning on the power amplifier; and

ramping modulation signals supplied to the power amplifier upon initiation of a said new packet transmission, wherein the modulation signals are in-phase and quadrature-phase signals and wherein the modulation signals are ramped by monotonically scaling a set of digital words representing the in-phase and quadrature-phase signals.

Claims 18-19 (Cancelled).

20. (Original) The power ramping method as described in Claim 17 wherein initiation of the new packet transmission begins with a preamble.

21. (Currently Amended) In a spread spectrum transceiver having a power amplifier and a pair of up-converter mixers, an improved power ramping method comprising:

switching on the power amplifier after an end of a prior packet reception period and prior to a start ~~sufficiently in~~ advance of a new packet transmission; and

ramping modulation signals supplied to the up-converter mixers upon initiation of a new packet transmission, wherein the modulation signals are in-phase and quadrature-phase signals and wherein the modulation signals are ramped by monotonically scaling a set of digital words representing the in-phase and quadrature-phase signals.

Claims 22-25 (Cancelled).
